

Artem Zabava

Senior Software Development Engineer

Nesebar, Bulgaria | artemzabava94@gmail.com | [LinkedIn](#) | artemzabava.dev

SUMMARY

Full-stack engineer with over 5 years of experience building products in fintech, logistics, HRM, and infrastructure domains. My primary stack includes TypeScript, Node.js, React, Go and AWS. I care deeply about code quality, readability, and building systems that other developers can easily understand. I'm particularly interested in software architecture and engineering best practices, with a focus on building systems that remain reliable, scalable, and maintainable as they evolve.

SKILLS

Languages: TypeScript, JavaScript, Go, SQL, GraphQL

Backend: Node.js, NestJS, REST API, GraphQL, microservices, event-driven systems

Frontend: React, Redux, React Query, Vite, Tailwind CSS, shadcn/ui, Styled Components, Ant Design, Storybook, Playwright

Cloud & Infra: AWS (Lambda, API Gateway, SQS, S3, etc.), Docker, Kubernetes, Pulumi, SST, Git

Data & Observability: MongoDB, DynamoDB, Elasticsearch, Tinybird, Kafka, OpenTelemetry, Datadog, LogRocket, Elastic Stack

EXPERIENCE

Akvelon, Inc. | Software Development Engineer | May 2021 - Present

Full-stack engineer working within platform and product teams. Contributed to core architecture, system design, and developer tooling. Mentored junior engineers, helping improve code quality through regular code reviews and technical guidance.

Project: GPU Utilization Optimization Platform | May 2026 - Present

- Owned the frontend architecture while contributing to .NET backend services
- Implemented SSE-based real-time log streaming for low-latency observability of GPU workloads
- Built a client-side RBAC system to control access and actions based on user roles across the platform
- Automated API client and TypeScript type generation from OpenAPI specs, eliminating manual API sync issues between frontend and backend
- Set up testing infrastructure using unit tests, e2e and MSW, enabling reliable API mocking and smooth frontend development independent of backend readiness

Tech stack: .NET, React, TypeScript, Kubernetes, Tanstack React Query, Zustand, Fluent UI, Vite, MSW, Docker, Playwright, Azure.

Project: Internal Tools & R&D | Jan 2026 - May 2026

- Built Azure Functions-based RAG pipeline for automated enrichment of task descriptions
- Developed cross-platform developer productivity tools (Go backend, VS Code extension, Chrome extension)
- Contributed to internal AI research initiatives and engineering prototypes for automation workflows

- Refactored legacy internal systems to improve maintainability and reduce technical debt

Tech stack: Go, Node.js, React, TypeScript, RTK Query, MUI, shadcn/ui, Tailwind CSS, Azure.

Project: Enterprise API Gateway & Extensibility Platform | Jun 2025 - Jan 2026

- Developed an API gateway and transformation layer over multiple backend services, helping standardize authentication and external integration contracts
- Implemented transformation plugins and a Kafka-based event routing service to normalize payloads and route events to customer-defined functions
- Introduced OpenTelemetry instrumentation to track gateway overhead and simplify troubleshooting in production
- Built internal tools that reduced development overhead, including generation of API Gateway configs and SDKs from OpenAPI specifications

Tech stack: TypeScript, Go, Kong Gateway, Kafka, Docker, OpenTelemetry, Elastic Stack.

Project: Real-time Expense & Travel Management | Sep 2021 - May 2025

- Improved ERP integrations (NetSuite, Sage Intacct, QuickBooks) with robust sync control and failure recovery mechanisms
- Centralized RBAC system using AWS Lambda authorizer and DynamoDB-based permissions model
- Designed configurable CSV/Excel export engine with dynamic schema support
- Built analytics pipeline using Tinybird enabling fast financial reporting on large datasets
- Implemented passwordless authentication (OTP email-based login), improving security and UX
- Established reusable NestJS backend foundation and infrastructure patterns using Pulumi

Tech stack: TypeScript, NestJS, React, AWS, Microservices, MongoDB, DynamoDB, Elasticsearch, Tinybird, Vite, Tanstack React Query, Tailwind CSS, Storybook, GraphQL, Pulumi, SST, Datadog, LogRocket.
